VORTEX LOW CURE WHITE INK

Vortex Low Cure White is a low bleed, fast flashing, low tack, flexible curing non-phthalate plastisol screen printing ink.

Vortex Low Cure White has a very creamy viscosity which can be printed through mesh counts from 110 up to 305 - perfect for manual and automatic printing.

Vortex Low Cure White offers excellent printing performance over a wide range of textiles, including cotton, 50/50, tri-blends and some 100% polyester. Testing is always recommended on dye migration prone garments prior to production.

Flash Curing:

Vortex Low Cure White will flash dry with very little after tack and will flash at a lower temperature than standard plastisol. Flash times and temperature will vary depending on what type of Flash Cure unit is used. When Flashing, you want to only partially fuse or gel the ink surface, so that it is dry to the touch but not completely fused. If the ink is completely fused or cured, the under-print white can lead to inter-coat adhesion issues with the top colors printed over the white cracking or losing wash fastness.

Curing:

Vortex Low Bleed White can be cured at dryer temperatures from 275 to 325 degrees, offering greater flexibility and energy savings.

The addition of any reducers or additives can lower the bleed resistance and opacity of the ink as well as increase flash and cure times.
